Oakmead Village Court Superfund Site Lowney Associates has been performing ground water characterization, cleanup and monitoring of an EPA Superfund site at 2986 Oakmead Village Court, Santa Clara, California. Ground water beneath the approximately one-acre light industrial site is impacted with solvents, such as trichloroethene (TCE). Ground water cleanup was initiated on-site in 1991 and by 1995 solvent concentrations had sufficiently decreased to permit the Regional Water Quality Control Board (RWQCB) to approve the shut-down of the cleanup program, one of the first such approvals for a superfund site in California. Ground water monitoring remains ongoing.
